AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A method for controlling a bias power of an optical disk device, comprising:

generating a bottom envelope envelope signal from a power sampling signal sensed by a photodiode of the optical disk device;

sampling the bottom envelope signal; and

controlling a bias power of the optical disk device in responsive to the sampled bottom envelope signal[.].

wherein a frequency of the bottom envelope signal is lower than that of the power sampling signal.

- 2. (Canceled)
- 3. (Original)The method according to claim 1 wherein the step of generating the bottom envelope signal comprises:

obtaining a negative half-wave of the power sampling signal;

selecting a candidate signal from the negative half-wave of the power sampling signal and the bottom envelope signal; and

obtaining a bottom value of the candidate signal as a next bottom envelope signal.

4. (Original) The method according to claim 3 wherein a high frequency signal of the next bottom envelope signal is filtered out before performing the sampling AMENDMENT (10/699,740)

step.

5. (Currently Amended) A method for controlling a write power of an optical disk device, comprising:

generating a peak envelope envelope signal from a power sampling signal sensed by a photodiode of the optical disk device;

sampling the peak envelope signal; and

controlling a write power of the optical disk device in responsive to the sampled peak envelope signal[.].

wherein a frequency of the peak envelope signal is lower than that of the power sampling signal.

- 6. (Canceled)
- 7. (Original) The method according to claim 5 wherein the step of generating the peak envelope signal comprises:

obtaining a positive half-wave of the power sampling signal;

selecting a candidate signal from the positive half-wave of the power sampling signal and the peak envelope signal; and

obtaining a peak value of the candidate signal as a next peak envelope signal.

8. (Original) The method according to claim 7 wherein a high frequency signal of the next peak envelope signal is filtered out before performing the sampling step.

9. (Currently Amended) A bias power control circuit of an optical disk drive, comprising:

a bottom envelope acquiring circuit for outputting a bottom envelope signal in responsive to a power sampling signal sensed by a photodiode of the optical disk device; and

a bias-period sample-and-hold circuit for sampling and outputting the bottom envelope signal wherein the bias power is controlled according to the sampled bottom envelope signal[.], and

wherein a frequency of the bottom envelope signal is lower than that of the power sampling signal.

- 10. (Canceled)
- 11. (Currently Amended) The bias power control circuit of claim 9 wherein the bottom envelope acquiring circuit further comprises:

a selector for outputting a candidate signal selected from the bottom envelope signal and a negative half-wave of the power sampling signal; and

a bottom detector for obtaining a bottom value of the candidate signal as a next bottom envelope signal.

12. (Original) The bias power control circuit of claim 11 further comprising an amplifier for filtering out a high frequency signal of the next bottom envelope signal before being sampled.

(10/699,740)

13. (Original) The bias power control circuit of claim 11 wherein a diode driving circuit of the optical disk drive adjusts the bias power according to the sampled bottom envelope signal.

14. (Currently Amended) A write power control circuit for an optical disk drive, comprising:

a peak envelope acquiring circuit for outputting a peak envelope signal in responsive to a power sampling signal sensed by a photodiode of the optical disk device; and

a write-period sample-and-hold circuit for sampling and outputting the peak envelope signal wherein the write power is controlled according to the sampled peak envelope signal[.], and wherein a frequency of the peak envelope signal is lower than that of the power sampling signal.

15. (Canceled)

16. (Currently Amended) The write power control circuit of claim 14 wherein the peak envelope acquiring circuit further comprises:

a selector for outputting a candidate signal selected from the peak envelope signal and a positive half-wave of the power sampling signal; and

a peak detector for obtaining a peak value of the candidate signal as a next peak envelope signal.

17. (Original) The write power control circuit of claim 16 further comprising an AMENDMENT (10/699,740)

amplifier for filtering out a high frequency signal of the next peak envelope signal before being sampled.

18. (Original) The write power control circuit of claim 14 wherein a diode driving circuit of the optical disk drive adjusts the write power according to the sampled peak envelope signal.

AMENDMENT (10/699,740)
